

Porcelain Veneers

***Have you ever wished you had better looking teeth?
NOW YOU CAN!!***

Veneers are a fantastic way to fix front teeth.

You can whiten your teeth, close spaces between your teeth and create a great smile.

We can even do virtually instant orthodontics to straighten crooked teeth!

What are Porcelain Veneers?

Veneers are thin porcelain shells that are bonded on the front of your teeth. It makes a fantastic makeover for your teeth and rejuvenates your smile.

These veneers are about 0.3mm to 0.5mm in thickness but are very strong once bonded to your teeth. They have a "life-like" appearance with the strength, beauty, and durability only porcelain restorations can afford.

Veneers have several advantages over crowns. There is no "dark line" that is sometimes seen with older front caps. They transmit light better and, therefore, have a more translucent appearance giving a natural, aesthetic look.

Veneers do not require as much grinding of tooth structure that crowns do, yet they accomplish a lifelike aesthetic result.

How is it done?

After a thorough discussion with your dentist to establish just what you wish to accomplish, & what can or can not be done, the desired teeth are prepared and an impression is taken of the teeth. You will be fitted with temporary veneers whilst your porcelain ones are being made. Two weeks later you return and will be fitted with your new veneers. The results are instant and spectacular!

Many times, we combine tooth whitening with porcelain veneers to make that perfect smile. If some front teeth are already badly broken down, we can place all new porcelain crowns combined with veneering and other cosmetic techniques. If you have any questions in regards to veneers or other cosmetic dentistry, please do not hesitate to speak to us.
